Q-10. PUB. : Izv. AN UzSSR, 1956, No. 6, 35-45

ABSTRACT : Methods are described of the preparation of soils for the cultivation of tea under the conditions of Middle Asia by means of applying S, ammonium sulfate and ammonium phosphate in pure form and in mixture with manure. Experiments were conducted on dark carbonate-free sierozem, turf-chestnut soil and on alluvial meadow carbonate-free soil in the valley of Angren. — T. I. Karelin

Title : Investigation of the Effect of the Chemical Composition on Magnetic
Properties of Electrotechnical Iron.

Orig Pub : Tr. Mosk. aviats. id-ta, 1956, vyp. 60, 4-12

Abstract : A statistical study was made of the effect of grain size of the micro-structure and of the chemical composition on the value of H_c of Armco iron, using data obtained in regular production shop tests of the melts (chemical and metallographic data). The correlation coefficient between the value of H_c and the percentage carbon content was found to be $r_{0,1} = 0.301$, and the correlation between H_c and the percentage sulphur contents was $r_{0,2} = 0.372$. H_c increases with increasing contents of C or S. The content of Mn, P, M1, and Cu, does not exert a noticeable effect on H_c provided its value is within the GOST standard limit. A statistical comparison of the data on the size of the grain of the micro-structure of Armco iron and on H_c disclosed a linear relationship between these quantities, and the correlation coefficient was

Card : 1/2

Category : USSR/Magnetism - Ferromagnetism

F-4

Abs Jour : Ref Zhur Fizika, No 1, 1957 No 1415

found to be $r_{0,3} = 0.555$. The maximum effect on H_c is exerted by the size of the micro-structure grain. The value of H_c increases with diminishing grain size. The joint simultaneous influence of the three factors on H_c of Armco iron is given by the multiple correlation coefficient

$$R_{0,1,2,3} = \sqrt{0.217 r_{0,1} + 0.208 r_{0,2} + 0.512 r_{0,3}} = 0.653.$$

AUTHOR: Zaychikov, P. F.

S/2789/63/000/050/0016/0020

TITLE: Aerological observations during the total phase period of the solar eclipse of 15 Feb 1961 .

SOURCE: Tsentral'naya aerologicheskaya observatoriya. Trudy*, no. 50, 1963, 16-20

TOPIC TAGS: solar eclipse, aerological observation, radio sounding, A-22-III radiosonde, RKZ-1 radiosonde

ABSTRACT: In this paper, the author presents the superheating of heat receivers of the radiosondes A-22-III and RKZ-1 by observations made during the total phase of the solar eclipse of 15 Feb 1961; some analyses of the heating magnitudes are also given. The launching schedule for the various radiosondes during the solar eclipse are presented in a table. Radio sounding at Simferopol' Rostov-on-Don, Volgograd, and Saratov stations were conducted with the aid of an A-22-III radiosonde and a "Malachit" radiotheodolite; at the Bezenchuk and Eastern Dubrava stations, it was conducted with the aid of an RKZ-1 radiosonde and radar. The results of the soundings are presented in tables. The following conclusions are drawn: a) radiation heating of the heat receivers of A-22-III and RKZ-1 is well adjusted by the

Card 1/2

ACCESSION NR: AT4028680

radiation corrections presented in Metodicheskiya ukazaniya (Methodical instructions) No. 25, b) the heating of the A-22-III heat receivers relative to that calculated by radiation correction amounts to a value equal to $0.2-0.4^{\circ}$, c) the very high heating of the A-22-III heat receivers 1 hour and 46 minutes after the total phase of the solar eclipse, each being observed by three aerological stations, will require supplementary investigation. Orig. art. has: 4 formulas and 3 tables.

CHINA/Geophysics - River Works

Sep/Oct 51

"People's Construction on the Huai Ho," V. T. Zaychikov, Inst of Geog, Acad Sci USSR

"Iz Ak Nauk SSSR, Ser Geog" No 5, pp 58-62

A magnificent project to save the Chinese people from floods, to provide artificial irrigation, to create navigational conditions on rivers and to exploit hydroelec power is under way on the Huai Ho. At the lower region of the river a canal 175 meters long will give an exit to the sea. The project, started in 1950, is supposed to be completed in 1953.

Treatment of Patients with Cancer of the Cervix.

Orig Pub: Vestn. rentgenol. i radiologii, 1957, No 1, Pri-
logeniye, 4-5.

Abstract: A decrease in the amount of ascorbic acid was
observed in 110 cases of cancer of the cervix,
when treated by X-Ray therapy. The level was
decreased to 0.3 to 0.01 milligram percent (from
a norm of 1.5 to 2 milligrams percent). Seventy-
four cases during an X-Ray therapy treatment,
received internally 1,500 milligrams of ascorbic

Abstract: acid or 1,000 milligrams of ascorbic acid intravenously per day, for 10-20 days. All the patients of this group completed a course of X-Ray therapy with satisfactory indications of peripheral blood count. In a group of 36 patients who did not receive any ascorbic acid, lymphopenia and an accelerated ROE [reaction of erythrocyte sedimentation], were observed. Because of this observation, X-Ray therapy was discontinued for some cases. -- S. Ya. Marmorshteyn

Title : New Photo-Colorimetric Method for Determining Zinc with Rhodanide-Ion and Rhodamine-C.

Orig Pub : Zavod. laboratoriya, 1955, 21, No 11, 1304-1307

Abstract : Description of a photo-colorimetric method for determining small amounts of zinc (from 0.2 to 1%) in poor ores, floatation tailings, and pyrite concentrates, using the color reaction between zinc and the rhodanide-ion and rhodamine-C. The effect of the tri-valent iron is eliminated by reducing it with hydroxyl-amine chloride, and the copper (up to 1%) is bound by thiourea into a colorless complex, which does not interfere with the zinc determination; if the copper content is high it is removed with sodium thiosulphate. The duration of the determination of zinc in one sample comprising two parallel batches is 45 -- 50 minutes. The reproducibility of the results was 5%. The zinc concentration range of 0.02 -- 1.0%.

TITLE: The Complexometric Determination of the Lead Content in Lead Concentrations (Kompleksometricheskoye opredeleniye svintsa v svintsovykh kontsentratakh)

PERIODICAL: Zavodskaya Laboratoriya, 1957, Vol. 23, Nr 8, pp. 910-911, (USSR)

ABSTRACT: For determining the lead content in lead concentrations the already known method of complex titration after previous elimination of lead-concomitant elements according to the sulfate method is employed. It is known that lead concentrations often contain various additions in considerable quantities: up to 26% silicic acid, up to 30% pyrite, up to 15% of the oxides of calcium, copper, aluminum etc. and nearly always also barium in the form of baryte. By treatment of the sample with sulfuric acid the lead is separated from the majority of the other elements with the exception of barium and calcium, if they are present in certain quantities which exceed the solubility of their sulfates in the solution to be investigated. Therefore a precise investigation has to be made of the influence of the barium and calcium content on the complexometric determination. According to existing data barium reduces the results due to the formation of ammonium acetate which is difficult to dissolve. Calcium, however, increases the results. Up to 2% the baryte content is of no influence, but above that it effects a reduction of the results, which

Card 1/2

32-8-7/61

The Complexometric Determination of the Lead Content in Lead Concentrations.

can, however, be avoided by filtering away baryte together with the insoluble companion after the action of nitric and hydrochloric acid. CaO content up to 16% is not disturbing, since such quantities of calciumsulfate dissolve and do not come into the titration solution. It was also found that the content of 7 g sodium- or ammonium-acetate in volumes of from 90 to 100 ml exerts no disturbing influence. Temperature variations between 20-35° C in the titration solution exert no influence on the results. Two analysis processes (on a barium content up to 2% and a higher barium content) are described here. There are 1 table and 2 references.
